"A comparative study of partial primary structures of the catalytic
region of mammalian protein C.";
Br. J. Haematol. 86:590-600(1994).
-!- FUNCTION: PROTEIN C IS A VITAMIN K-DEPENDENT SERINE PROTEASE THAT
REGULATES BLOOD COAGULATION BY INACTIVATING FACTORS VA AND VIIIA
IN THE PRESENCE OF CALCIUM IONS AND PHOSPHOLIPIDS.
-!- CATALITIC ACTIVITY: Degradation of blood coagulation factors Va
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       15-DEC-1998 (Rel. 37, Created)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       acute and chronic inflammation and infections caused by viruses or microorganisms. The diagnostic kits are useful for the detection of these illnesses and for the detection of the transport molecule and/or its distribution in vivo. The ligands have excellent solubility in the medium at the site of action and are easy and inexpensive to covert into AABB6643-AABB6920 represent peptides used to illustrate the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        This invention describes novel ligands which bind to transport molecules, comprising a therapeutic and/or diagnostic agent (A) non-covalently bonded via a linkage cleavable in vivo depending on pH and/or enzymatically with a substance (B) having an association constant KA to a transport molecule of above 10^3 M^-^1, is new. The medicaments are especially useful for the treatment of cancers, autoimmune diseases,
                                                                                                                                                                                                          Gaps
                                           The sequences given in AAR25311-19 are cyclic peptides which act as contact inhibitors of animal cells. They are resistant to decomposition by Mydrolytic enzymes and can be maintained at high lavels of activity for a long period in vivo. The peptides are cyclic and may have 1-16 pref. 1-4 amino acids.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Transport molecule; ligand; cancer treatment; autoimmune disease; inflammation; infection.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to a method of stimulating growth and repair of cartilage. The method involves administering to the site, an agonist of non-protecolytically activated thronin receptor (WRAR). The method is used in human or veterinary medicine for the treatment of arthritic joints and damage/loss of cartilage caused by traumatic injury. Also chondrocytes may be cultured in presence of NPAR agonist to provide cells for implantation at sites requiring growth/repair of cartilage. The present sequence is human thrombin peptide. The derivatives of thrombin peptide which serves as a NPAR agonist.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Cartilage growth, cartilage repair; arthritic joint; traumatic injury; non-proteolytically activated thrombin receptor; NPAR; chondrocyte; therapy; implantation; thrombin peptide; human.

The present sequence is that of a thrombin receptor binding domain peptide that is used in a claimed method for promoting cardiac peptide that is used in a claimed method for promoting cardiac trissue repair. The method involves administering an angiogenic thrombin derived peptide. The peptide comparises the present thrombin receptor binding domain together with a scrine esterase conserved sequence (see AAM50857), or preferably a peptide (see AAM50858) which includes both these sequences. The thrombin-derived peptide is administered during or following cardiac surgery by injection into cardiac tissue, and may be formulated as a sustained release formulation. It is used in claimed methods of stimulating revascularisation, stimulating vascular nedothelial cell creatency inhibiting vascular occlusion, and inhibiting restencial peptide may be coated onto the catheter.
                                                                                                                                                 Promoting cardiac tissue repair, stimulating revascularisation, stimulating vascular endothelial cell proliferation, and inhibiting vascular occlusion by using anglogenic thrombin derivative peptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The sequences given in AAR24514-8 are peptides which are useful as platelet antagonists. These peptides have higher activity than the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New peptide(s) comprising arginine-glycine-asparagine and hyaluronic acid - useful as platelet antagonists with higher activity than arginine-glycine-asparagine-valine
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 100.0%; Score 21; DB 23;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention describes a method of stimulating bone growth at a site in a subject in need of osteoinduction. The method involves administering an agonist to stimulate bone growth at a site in a subject (e.g. a farm animal, companion animal or laboratory animal), in need of osteoinduction, such as the site in need of a bone graft in a subject, a segmental bone gap, a bone void or a non-union fracture. This sequence represents a thrombin peptide derivative obtained from a serine esterase that can stimulate or activate the non-proteolytically
                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Stimulating bone growth at a site in a subject in need of osteoinduction, such as a site of bone graft, segmental bone gap, bone vold or non-union structure, by administering agonist of activated
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Thrombin receptor binding domain; thrombin; revascularisation; vascular occlusion; tissue repair; vulnerary; vasotropic; cardiant; angiogenesis; restenosis; therapy; human.

      human immunodeficiency virus (HIV) by treating the virus, or its target cell, with a thrombospondin or thrombospondin analogue. Thrombospondin blocks binding of HIV to its cellular receptors. Thrombospondin or its analogues can used to prevent infection by HIV, in both contraceptive and non-contraceptive compositions/devices. They are already known to reduce infectivity of some bacteria and protozoa. The present sequence represents a human thrombospondin-1 type III repeat peptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present invention describes a method for suppressing infectivity of human immunodeficiency virus (HIV) by treating the virus, or its target

The present invention relates to a method for inhibiting thrombin cartivation in a human cell expressing protease activated receptor 1 (PARI). The method involves using peptides (e.g. the present peptide) that inhibit platelet activation. The method is useful for preventing thrombosis and platelet aggregation. The method can be used for patients with acute coronary syndromes (e.g. cresende anglan, myccardial infarction) and for individuals who have acute coronary syndromes and receive percutaneous transluminal coronary angioplasty with an artificle
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              activated receptor 1 (PAR1), comprises contacting mixtures of thrombi
and human cell expressing PAR1, with a peptide that inhibits platelet
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        cell attachment; cell detachment; fermentation; therapy
                                                   Platelet aggragation inhibitor; thrombin activation inhibitor; protease activated receptor 1; PARI; platelet activation inhibitor; thrombosis; acute coronary syndrome.

                                                                                                                                                                                                              ö
                                                                             Synthetic peptide(s) from fibronectin- used in control of cell attachment
                                                                                                                     This polypeptide mediates the attachment of animal cells to substrates. The substrate (I) is contacted with cells and with a soln. contg. this polypeptide. This attachment can be prevented in addition to detaching the cells from (I) once attached. Applications are in eg fermentation, cell line prepn., diagnosis and therapy.
                                                                                                                                                                                                              Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The peptide, or shorter versions contg. the RGD active site from fibronectin, can be used to prevent and reverse attachment of cells to substrates. This can be used in cell prodn., fermentation, cell line prepn., cell matrix prodn., diagnostics and therapy. The

The present invention describes a zinc finger protein (I) that binds to a target site, comprising a first (FI), a second (F2), and a third (F3) a target site, comprising a first (FI), a second (F2), and a third (F3) target site comprises, in 3'-5' direction, a first (S1), a second (S2), and a third (S3) target subsite. Also described are: (I) a polypeptide (II) (C1) a polynuclectide (III) encoding (I) or (III); and (I) (I) involves selecting the F1 zinc finger such that (I) thinds to the S1 target subsite, and selecting the F2 zinc finger such (I) that binds to the S2 target subsite, and selecting the F3 zinc finger such that it binds to the S3 target subsite, and selecting the F2 zinc finger such that binds to a target site. (I) is useful for recognition of triplet target subsites having the nucleotide G in the 5'-most position of the subsite (I) is useful in studying gene function, and for human therapeutics and plant engineering (I) (II) or (III) is useful in therapeutic methods to modulate the expression of a target region within
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New zinc finger protein that binds to target site, useful in studying gene function and for human therapeutics and plant engineering, comprises first, second and third zinc fingers, ordered from N- to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps
peptide can be used for eg mobilisation of bone marrow cells; prevention and reversal of attachment of disseminated tumour cells locally such as in the case of an operation performed in the peritonal cavity, to prevent adhesions and scar formations locally as binding to epithelial cells of the urinary tract or intestine, diagnosis and treatment of E. coli related infections, and identification of various pathogenic bacterial strains. The peptide is pref. prepd. by solid phase synthesis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Zinc finger protein; ZFP; DNA binding protein; zinc finger

a target site, comprising a first (FI), and a third (FI) and a third (FI) and a third (FI) and a third (FI) and a third (FI).

In finger, ordered FI, F2, F3 from N-terminus to C-terminus, where the target site comprises, in 3'-5' direction, a first (SI), a second (S2), and a third (SI) target subsite. Also described are: (I) a polypeptide (II) encoding (I) or (II); and (II) ends to the SI target subsite, selecting the F2 zinc finger such that to binds to the SI target subsite, and selecting the F3 zinc finger such that it binds to the SI target subsite, and selecting the F3 zinc finger such that it binds to the SI target subsite, thus designing (I) that binds to a target site. (I) is useful for recognition of triplet target subsites having the nucleotide G in the 5'-most position of the subsite. (I) is useful in studying gene function, and for human therefore the expression of a target region within a subject; in diagnostic methods for sequence specific detection of target uncleic acid in a sample, and in assays to determined the phenotype and function of gene expression. (I) has improved affinity
                                                                                                                                                                                                                                                                     ö
a subject, in diagnostic methods for sequence specific detection of target nucleic acid in a sample, and in assays to determined the phenotype and function of gene expression. (I) has improved affinity and specificity for their target sequences, as well as enhanced biological activity. AB071213 to AB072214 and ABP48191 to ABP51230 represent DNA target sequences and zinc finger peptides which are given in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          invention describes a zinc finger protein (I) that binds to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New zinc finger protein that binds to target site, useful in studying gene function and for human therapeutics and plant engineering, comprises first, second and third zinc fingers, ordered from N- to

The present invention describes a zinc linyer process.

The present invention describes a zinc linyer process.

The present invention describes a zinc describe that the comprises, in 3'-5' direction, a first (S1), and a third (F3) and a third (S3) target subsite. Also described are: (1) a polypeptide (I) comprising (I); (2) a polynucleotide (III) encoding (I) or (II); and (I) involves selecting the F1 zinc finger such that it binds to the S1 target subsite, selecting the F2 zinc finger such that It binds to the S2 target subsite, and selecting the F3 zinc finger such that it binds to the S2 target subsite, and selecting the F3 zinc finger such that it binds to the S2 target subsite, and selecting the F3 zinc finger such that it binds to the S3 target subsite, and selecting the F3 zinc finger such that it binds to the S3 target subsite, and selecting the F3 zinc finger such that it binds to the S3 target subsite, and selecting the farile to that binds to a target site. (I) is useful in studying gene function, and for human to therapeutic methods to modulate the expression of a target region within a subject, in diagnostic methods for sequences specific detection of the compensation of gene expression. (I) has improved affinity and specificity for their target sequences, as well as enhanced to represent DNA target sequences and zinc finger peptides which are given represent DNA target sequences and zinc finger peptides which are given
                                                                                                                                                                                 ö
and specificity for their target sequences, as well as enhanced biological activity. ABQ71213 to ABQ7214 and ABP48191 to ABP51230 represent DNA target sequences and zinc finger peptides which are given in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention describes a zinc finger protein (I) that binds to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New zinc finger protein that binds to target site, useful in studying gene function and for human therapeutics and plant engineering, comprises first, second and third zinc fingers, ordered from N- to
                                                                                                                                                                                 Gaps

The present invention describes a zinc finger protein (I) that binds to a target site, comprising a first (FI), a second (F2), and a third (F3) is target site, comprises, in 3'-5' direction, a first (S1), a second (S2), and a third (S3) target subsite. Also described are: (I) a polypeptide (II) encoding (I) or (II); and a third (S3) target subsite. Also described are: (I) a polypeptide (II) encoding (I) or (II); and (S1) designing (M) (I) involves selecting the F1 zinc finger such that it binds to the S2 target subsite, alecting the F2 zinc finger such that it binds to the S2 target subsite, and selecting the F3 zinc (I) at that it binds to the S2 target subsite, and selecting the F3 zinc that binds to a target subsite, (I) is useful for recognition of triplet target subsites having the nucleotide G in the 5'-most position of the subsite. (I) is useful in studying gene function, and for human charapeutics and plant engineering. (I), (II) or (III) is useful in the charapeutic methods to modulate the expression of a target region within a subject, in diagnostic methods and in assays to determined the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              phenotype and function of gene expression. (1) has improved affinity and specificity for their target sequences, as well as enhanced biological activity. ABQ71213 to ABQ72214 and ABP48191 to ABP51230 represent DNA target sequences and zinc finger peptides which are given in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New zinc finger protein that binds to target site, useful in stugene function and for human therapeutics and plant engineering, comprises first, second and third zinc fingers, ordered from N

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present invention describes a zinc finger protein (I) that binds to a target site, comprising a first (FI), a second (F2), and a third (F3) zinc finger, ordered F1, F2, F3 from Witerminus to C-terminus, where the target site comprises, in 3'-5' direction, a first (SI), a second (S2), and a third (S3) target subsite. Also described are: (I) a polypeptide (II) comprising (II); (2) a polypuclectide (III) encoding (I) or (III); and (I) or (III) and (I) or (III) and (I) or (III) and (I) or (III) and (I) involves selecting the F2 zinc finger such that it binds to the S1 target subsite, and selecting the F3 zinc finger such that it binds to the S3 target subsite, and selecting the F3 zinc finger such that it binds to the S3 target subsite, thus designing (I) that binds to a target subsite, its useful for recognition of triplet target subsites having the nuclectide G in the 5'-most position of the capter subsite. (I) is useful in studying gene function, and for human therapeutics and plant engineering (I), (II) or (III) is useful in the starget region within
                                                                                                                                                                                                                        ô
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           a subject, in diagnostic methods for sequence specific detection of target nucleic acid in a sample, and in assays to determined the phanotype and function of gene expression. (I) has improved affinity and specificity for their target sequences, as well as enhanced and specificity for their target sequences, as well as enhanced blobogloal activity, AB071213 to AB07214 and ABR48191 to ABB51230 represent DNA target sequences and zinc finger peptides which are given in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New zinc finger protein that binds to target site, useful in studying gene function and for human therapeutics and plant engineering, comprises first, second and third zinc fingers, ordered from N- to C-terminus --

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Sequence 100, Application US/09139762A
Patent No. 6013453
GENERAL INFORMATION:
APPLICANT: Choo, Yen
APPLICANT: Klug, Aaron
APPLICANT: Sanchez Garcia, Isidro
APPLICANT: Bunchez Garcia, Isidro
TITLE OF INVENTION: Improvements in or Relating to
TITLE OF INVENTION: Binding Proteins for Recognition of DNA
NUMBER OF SEQUENCES: 125
CORRESPONDENCE ADDRESS:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 100.0%; Score 21; DB 1; Length 10; 100.0%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Sequence 14, Application US/08475411A
Patent No. 6140072
GENERAL INFORMATION:
APPLICANT: Cappello, Joseph
TITLE OF INVENTION: Functional Recombinantly Prepared
TITLE OF ENVENTION: Synthetic Protein Polymer
NUMBER OF SEQUENCES: 119
CORRESPONDENCE ADDRESS:
ADDRESSEE: Flehr, Hobbach, Test, Albritton & Herbert
STREET: Four Embarcadero Center, Suite 3400
                                                                                                                                                                                                SOFTWARE: Patentin Release #1.0, Version #1.30
CURRENT APPLICATION DATA:
APPLICATION NUMBER: US/08/482,085B
FILING DATE: US-JUN-1995
CLASSIFICATION: 435
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              SYSTEM: PC-DOS/MS-DOS
